# Exemplar Course 5 TikTok project lab

October 1, 2024

# 1 TikTok Project

#### Course 5 - Regression Analysis: Simplify complex data relationships

You are a data professional at TikTok. The data team is working towards building a machine learning model that can be used to determine whether a video contains a claim or whether it offers an opinion. With a successful prediction model, TikTok can reduce the backlog of user reports and prioritize them more efficiently.

The team is getting closer to completing the project, having completed an initial plan of action, initial Python coding work, EDA, and hypothesis testing.

The TikTok team has reviewed the results of the hypothesis testing. TikTok's Operations Lead, Maika Abadi, is interested in how different variables are associated with whether a user is verified. Earlier, the data team observed that if a user is verified, they are much more likely to post opinions. Now, the data team has decided to explore how to predict verified status to help them understand how video characteristics relate to verified users. Therefore, you have been asked to conduct a logistic regression using verified status as the outcome variable. The results may be used to inform the final model related to predicting whether a video is a claim vs an opinion.

A notebook was structured and prepared to help you in this project. Please complete the following questions.

# 2 Course 5 End-of-course project: Regression modeling

In this activity, you will build a logistic regression model in Python. As you have learned, logistic regression helps you estimate the probability of an outcome. For data science professionals, this is a useful skill because it allows you to consider more than one variable against the variable you're measuring against. This opens the door for much more thorough and flexible analysis to be completed.

The purpose of this project is to demostrate knowledge of EDA and regression models.

**The goal** is to build a logistic regression model and evaluate the model. This activity has three parts:

Part 1: EDA & Checking Model Assumptions \* What are some purposes of EDA before constructing a logistic regression model?

Part 2: Model Building and Evaluation \* What resources do you find yourself using as you complete this stage?

#### Part 3: Interpreting Model Results

- What key insights emerged from your model(s)?
- What business recommendations do you propose based on the models built?

Follow the instructions and answer the question below to complete the activity. Then, you will complete an executive summary using the questions listed on the PACE Strategy Document.

Be sure to complete this activity before moving on. The next course item will provide you with a completed exemplar to compare to your own work.

# 3 Build a regression model

# 4 PACE stages

Throughout these project notebooks, you'll see references to the problem-solving framework PACE. The following notebook components are labeled with the respective PACE stage: Plan, Analyze, Construct, and Execute.

#### 4.1 PACE: Plan

Consider the questions in your PACE Strategy Document to reflect on the Plan stage.

#### 4.1.1 Task 1. Imports and loading

Import the data and packages that you've learned are needed for building regression models.

```
[1]: # Import packages for data manipulation
   import pandas as pd
   import numpy as np

# Import packages for data visualization
   import matplotlib.pyplot as plt
   import seaborn as sns

# Import packages for data preprocessing
   from sklearn.preprocessing import OneHotEncoder
   from sklearn.feature_extraction.text import CountVectorizer, TfidfVectorizer
   from sklearn.utils import resample

# Import packages for data modeling
   from sklearn.model_selection import train_test_split
   from sklearn.linear_model import LogisticRegression
   from sklearn.metrics import classification_report
   from sklearn.metrics import confusion_matrix, ConfusionMatrixDisplay
```

Load the TikTok dataset.

**Note:** As shown in this cell, the dataset has been automatically loaded in for you. You do not need to download the .csv file, or provide more code, in order to access the dataset and proceed

with this lab. Please continue with this activity by completing the following instructions.

```
[2]: # Load dataset into dataframe
data = pd.read_csv("tiktok_dataset.csv")
```

#### 4.2 PACE: Analyze

Consider the questions in your PACE Strategy Document to reflect on the Analyze stage.

In this stage, consider the following question where applicable to complete your code response:

• What are some purposes of EDA before constructing a logistic regression model?

#### Exemplar response:

The purposes of EDA before constructing a logistic regression model are

- 1) to identify data anomalies such as outliers and class imbalance that might affect the modeling;
- 2) to verify model assumptions such as no severe multicollinearity.

#### 4.2.1 Task 2a. Explore data with EDA

Analyze the data and check for and handle missing values and duplicates.

Inspect the first five rows of the dataframe.

```
[3]: # Display first few rows
     data.head()
[3]:

Check class balance.

```
[18]: # Check class balance data["verified_status"].value_counts(normalize=True)
```

[18]: verified\_status
 not verified 0.93712
 verified 0.06288
 Name: proportion, dtype: float64

Approximately 94.2% of the dataset represents videos posted by unverified accounts and 5.8% represents videos posted by verified accounts. So the outcome variable is not very balanced.

Use resampling to create class balance in the outcome variable, if needed.

```
[19]: # Use resampling to create class balance in the outcome variable, if needed
      # Identify data points from majority and minority classes
      data_majority = data[data["verified_status"] == "not verified"]
      data minority = data[data["verified status"] == "verified"]
      # Upsample the minority class (which is "verified")
      data_minority_upsampled = resample(data_minority,
                                       replace=True,
                                                                     # to sample with
       →replacement
                                       n_samples=len(data_majority), # to match_

                                                       0.217661
                                                                    1.000000
```

Visualize a correlation heatmap of the data.

One of the model assumptions for logistic regression is no severe multicollinearity among the features. Take this into consideration as you examine the heatmap and choose which features to proceed with.

**Exemplar response:** The above heatmap shows that the following pair of variables are strongly correlated: video\_view\_count and video\_like\_count (0.86 correlation coefficient).

One of the model assumptions for logistic regression is no severe multicollinearity among the features. To build a logistic regression model that meets this assumption, you could exclude video\_like\_count. And among the variables that quantify video metrics, you could keep video\_view\_count, video\_share\_count, video\_download\_count, and video\_comment\_count as features.

#### 4.3 PACE: Construct

After analysis and deriving variables with close relationships, it is time to begin constructing the model. Consider the questions in your PACE Strategy Document to reflect on the Construct stage.

#### 4.3.1 Task 3a. Select variables

Set your Y and X variables.

Select the outcome variable.

```
[27]: # Select outcome variable
y = data_upsampled["verified_status"]
```

Select the features.

4

[28]:	video_duration_sec	claim_status	author_ba	n_status	video_view_count	\
0	59	claim	unde	r review	343296.0	
1	32	claim		active	140877.0	
2	31	claim		active	902185.0	
3	25	claim		active	437506.0	
4	19	claim		active	56167.0	
	video_share_count	video_downloa	d_count	video_com	ment_count	
0	241.0		1.0		0.0	
1	19034.0		1161.0		684.0	
2	2858.0		833.0		329.0	
3	34812.0		1234.0		584.0	

**Exemplar note:** The # and video\_id columns are not selected as features here, because they do not seem to be helpful for predicting whether a video presents a claim or an opinion. Also, video\_like\_count is not selected as a feature here, because it is strongly correlated with other features, as discussed earlier. And logistic regression has a no multicollinearity model assumption that needs to be met.

547.0

152.0

#### 4.3.2 Task 3b. Train-test split

Split the data into training and testing sets.

4110.0

Confirm that the dimensions of the training and testing sets are in alignment.

```
[30]: # Get shape of each training and testing set
X_train.shape, X_test.shape, y_train.shape, y_test.shape
```

```
[30]: ((26826, 7), (8942, 7), (26826,), (8942,))
```

### Exemplar notes:

- The number of features (7) aligns between the training and testing sets.
- The number of rows aligns between the features and the outcome variable for training (26826) and testing (8942).

#### 4.3.3 Task 3c. Encode variables

Check the data types of the features.

```
[31]: # Check data types
X_train.dtypes
```

```
[31]: video_duration_sec int64
    claim_status object
    author_ban_status object
    video_view_count float64
    video_download_count float64
    video_comment_count float64
    dtype: object
```

```
[32]: # Get unique values in `claim_status`
X_train["claim_status"].unique()
```

[32]: array(['opinion', 'claim'], dtype=object)

```
[33]: # Get unique values in `author_ban_status`
X_train["author_ban_status"].unique()
```

```
[33]: array(['active', 'under review', 'banned'], dtype=object)
```

As shown above, the claim\_status and author\_ban\_status features are each of data type object currently. In order to work with the implementations of models through sklearn, these categorical features will need to be made numeric. One way to do this is through one-hot encoding.

Encode categorical features in the training set using an appropriate method.

```
[34]: # Select the training features that needs to be encoded
X_train_to_encode = X_train[["claim_status", "author_ban_status"]]

# Display first few rows
X_train_to_encode.head()
```

```
[34]:

35705 verified
31060 verified
Name: verified_status, Length: 8942, dtype: object
```

Encode the true labels of the testing set so it can be compared to the predictions.

[55]: array([1., 1., 1., ..., 0., 1., 1.])

Confirm again that the dimensions of the training and testing sets are in alignment since additional features were added.

```
[56]: # Get shape of each training and testing set
X_train_final.shape, y_train_final.shape, X_test_final.shape, y_test_final.shape
```

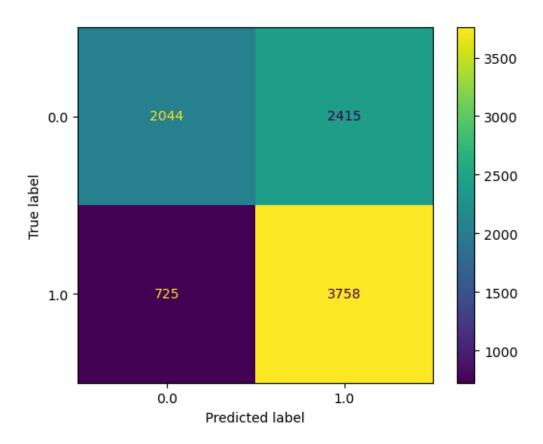

[56]: ((26826, 8), (26826,), (8942, 8), (8942,))

### Exemplar note:

- The number of features (8) aligns between the training and testing sets.
- The number of rows aligns between the features and the outcome variable for training (26826) and testing (8942).

## 4.4.2 Task 4b. Visualize model results

Create a confusion matrix to visualize the results of the logistic regression model.

[65]: (3758+2044) / (3758 + 725 + 2044 + 2415)

[65]: 0.6488481324088571

#### Exemplar notes:

The upper-left quadrant displays the number of true negatives: the number of videos posted by unverified accounts that the model accurately classified as so.

The upper-right quadrant displays the number of false positives: the number of videos posted by unverified accounts that the model misclassified as posted by verified accounts.

The lower-left quadrant displays the number of false negatives: the number of videos posted by verified accounts that the model misclassified as posted by unverified accounts.

The lower-right quadrant displays the number of true positives: the number of videos posted by verified accounts that the model accurately classified as so.

A perfect model would yield all true negatives and true positives, and no false negatives or false positives.

Create a classification report that includes precision, recall, f1-score, and accuracy metrics to evaluate the performance of the logistic regression model.

```
[58]: # Create classification report for logistic regression model
    target_labels = ["verified", "not verified"]
    print(classification_report(y_test_final, y_pred, target_names=target_labels))
```

	precision	recall	f1-score	support
verified	0.74	0.46	0.57	4459
not verified	0.61	0.84	0.71	4483
accuracy			0.65	8942
macro avg	0.67	0.65	0.64	8942
weighted avg	0.67	0.65	0.64	8942

**Exemplar note:** The classification report above shows that the logistic regression model achieved a precision of 61% and a recall of 84%, and it achieved an accuracy of 65%. Note that the precision and recall scores are taken from the "not verified" row of the output because that is the target class that we are most interested in predicting. The "verified" class has its own precision/recall metrics, and the weighted average represents the combined metrics for both classes of the target variable.

#### 4.4.3 Task 4c. Interpret model coefficients

[59]:	Feature Name	Model Coefficient
0	video_duration_sec	8.607893e-03
1	<pre>video_view_count</pre>	-2.132079e-06
2	video_share_count	5.930971e-06
3	video_download_count	-1.099775e-05
4	video_comment_count	-6.404235e-04
5	claim_status_opinion	3.908384e-04
6	author_ban_status_banned	-1.781741e-05
7	author ban status under review	-9.682447e-07

#### 4.4.4 Task 4d. Conclusion

- 1. What are the key takeaways from this project?
- 2. What results can be presented from this project?

#### Exemplar response:

Key takeaways:

• The dataset has a few strongly correlated variables, which might lead to multicollinearity issues when fitting a logistic regression model. We decided to drop video\_like\_count from

the model building.

- Based on the logistic regression model, each additional second of the video is associated with 0.009 increase in the log-odds of the user having a verified status.
- The logistic regression model had not great, but acceptable predictive power: a precision of 61% is less than ideal, but a recall of 84% is very good. Overall accuracy is towards the lower end of what would typically be considered acceptable.

We developed a logistic regression model for verified status based on video features. The model had decent predictive power. Based on the estimated model coefficients from the logistic regression, longer videos tend to be associated with higher odds of the user being verified. Other video features have small estimated coefficients in the model, so their association with verified status seems to be small.

Congratulations! You've completed this lab. However, you may not notice a green check mark next to this item on Coursera's platform. Please continue your progress regardless of the check mark. Just click on the "save" icon at the top of this notebook to ensure your work has been logged.
